iWay Enterprise Index (Powered by Google)

Indexing Process

iWay Adaptive Framework pushes data, security levels, etc. to Google Search Appliance for indexing.

- **Extend the Google Search Appliance's capabilities** to over 280 information systems, document types, and business-to-business interactions
- **Find information** previously hidden in free-form text fields or accidentally coded into the wrong field
- **Integrate document indexing** and archiving throughout the processing lifecycle
- **Provide integrated security** to ensure that no one sees information that they shouldn't
- **Translate information to and from XML formats** to help manage complex proprietary message types

Capture, Index, Search – Anything

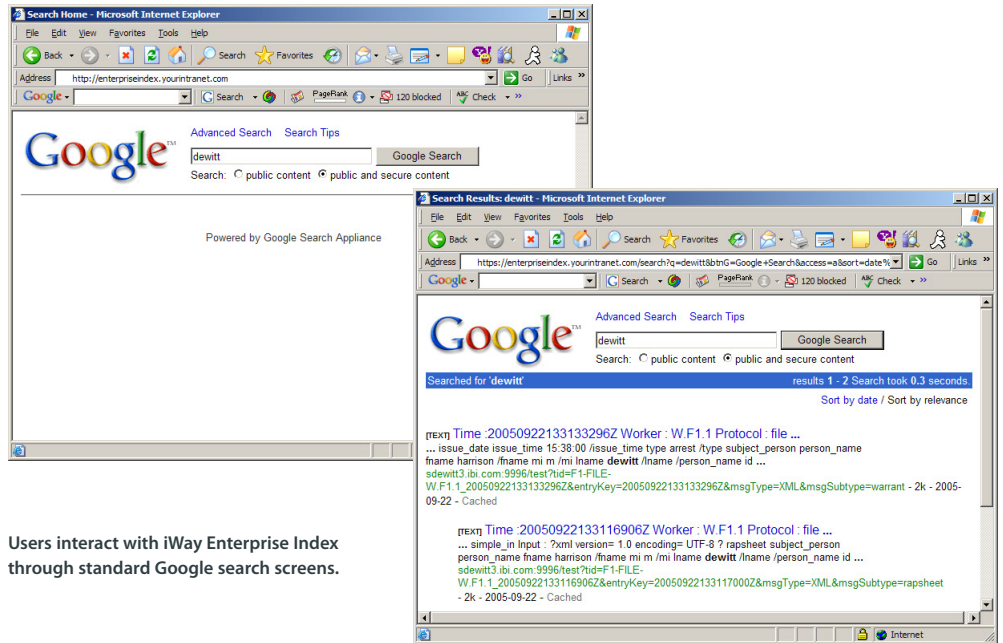

Information Faster Than Ever

iWay Software has brought together iWay's industry-leading application integration technology and the Google Search Appliance to create a completely new way to tap information within the integrated enterprise.

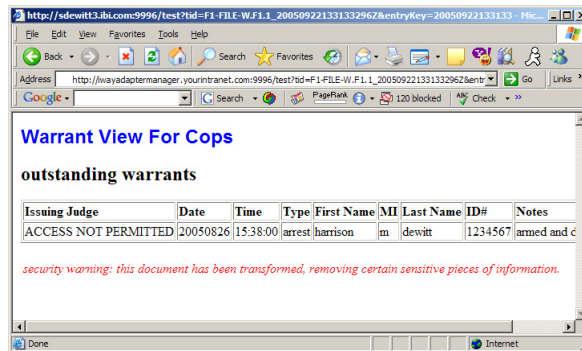

Enterprise data flows throughout an enterprise in hundreds of different ways. Organizations communicate with external entities using EDI messages, XML documents, and flat files; developers use the J2EE Connector Architecture (JCA) to work with ERP systems; and most organizations are beginning to use Web services to communicate internally or externally to achieve a service-oriented architecture (SOA).

Until now, there was no way to make all of this data available to end users in an easy-to-use, easy-to-maintain way. The iWay Enterprise Index (Powered by Google), however, taps into these streams of information, transforms them into more usable and uniform XML-based formats, and prepares them for searching by end users.

The result is rapid, at-your-fingertips easy retrieval of information that previously would have been locked up in proprietary information systems.

Users interact with iWay Enterprise Index through standard Google search screens.

Only the fields authorized for the end user will be shown.

How It Works

iWay Software provides an adaptive framework and over 280 adapters that can perform many key integration tasks, such as:

- Transform raw information into XML formats
- Standardize formats across different application and interface types
- Create sophisticated business processes and wrap them with XML interfaces
- Standardize business-to-business interactions across multiple protocols and formats

Now, as the iWay Adaptive Framework performs any of these tasks, it can hand data or documents off to a built-in Google Search Appliance – an all-in-one package of hardware and software that

stores and indexes the data as part of a complete enterprise search solution. And because it's based on Google technology, end users will be confident that they're getting the most relevant results possible.

This is information that the Google Search Appliance normally wouldn't find, because it normally indexes Web pages by "spidering" – starting on one Web page and following its hyperlinks to other pages. But most enterprise data doesn't have hyperlinks in it, and doesn't have hyperlinks pointing to it. Consider:

- **B2B:** When one company sends another a HIPAA document, there's no hyperlink pointing to it. There are also no hyperlinks in the HIPAA document pointing to other relevant HIPAA documents.
- **EAI:** If someone updates a customer address in SAP, the application will dutifully emit an IDoc that can be sent to other systems – but there's no hyperlink on a Web page pointing to the IDoc, and there's no hyperlink in the IDoc pointing to other relevant IDocs.

This unique combination of technologies – iWay standardizing content and providing it to the Google Search Appliance, and Google archiving and indexing the data and providing relevant results to search requests – provides the ability for end users to "surf" business content in ways that used to be limited to Web pages and a few other document formats.

Key Features

- **Search more systems.** With the iWay Adaptive Framework, all content from any application in the enterprise can be indexed for later searching. No other vendor comes close to supporting the 280 adapters that iWay Software provides.
- **Search every character of content.** By indexing all the words in every field, the iWay Enterprise Index makes all content, anywhere in the enterprise, searchable. Free-form text fields inside an EDI document? Searches will turn up information from them. Free-form text reports embedded in Web services? Before, administrators would have had to go through special processing to get Google to index them, but with iWay Enterprise Index it's trivial.
- **Search without knowing the query characteristics of a specific system.** Users generally have to know which systems contain the content they're interested in, and they have to follow an exact sequence of steps to get the information out. The iWay Enterprise Index eliminates some of that hassle: instead of having to go to, e.g., a specific mainframe screen, type some specific criteria (name, SSN, product ID, customer ID, whatever) into specific places, and run a very specific query, they can enter a few key words into a search page and start to see the information they need and where to get more information – regardless of its origin, form, or structure.
- **Search with security.** Even when opening up data for more and better use, it's important to protect it from unauthorized use. iWay Enterprise Index provides an additional layer of security that prevents unauthorized people from seeing results that contain information they're not allowed to receive. For example, if a search term returns 15 items, but the user is only allowed to see 10, they will only see 10 on the screen.
